This application claims the priority benefit of U.S. Provisional Application No. 60/397,256 filed July 19, 2002 and U.S. Provisional Application No. 60/447,213  
5 filed February 13, 2003, the disclosures of which are incorporated herein by reference in their entirety.

### **Field of the Invention**

This invention relates to compounds that inhibit the tyrosine kinase activity of  
10 growth factor receptors such as VEGFR-2 and FGFR-1, thereby making them useful as anti-cancer agents. The compounds are also useful in the treatment of diseases, other than cancer, which are associated with signal transduction pathways operating through growth factors and anti-angiogenesis receptors such as VEGFR-2.

### **Background of the Invention**

Normal angiogenesis plays an important role in a variety of processes including embryonic development, wound healing, obesity and several components of female reproductive function. Undesirable or pathological angiogenesis had been associated with disease states including diabetic retinopathy, psoriasis, rheumatoid  
20 arthritis, atheroma, Kaposi's sarcoma and haemangioma, asthma, cancer and metastatic disease (Fan et al, 1995, Trend Pharmacol. Sci. 16: 57-66; Folkman, 1995, Nature Medicine 1: 27-31). Alteration of vascular permeability is thought to play a role in both normal and pathophysiological processes (Cullinan-Bove et al, 1993, Endocrinology 133: 829-837; Senger et al, 1993 Cancer and Metastasis Reviews, 12:  
25 303-324).

Receptor tyrosine kinases (RTKs) are important in the transmission of biochemical signals across the plasma membrane of cells. These transmembrane molecules characteristically consist of an extracellular ligand-binding domain connected through a segment in the plasma membrane to an intracellular tyrosine  
30 kinase domain. Binding of ligand to the receptor results in stimulation of the receptor-associated tyrosine kinase activity that leads to phosphorylation of tyrosine residues on both the receptor and other intracellular proteins, leading to a variety of

cellular responses. To date, at least nineteen distinct RTK subfamilies, defined by amino acid sequence homology, have been identified. One of these subfamilies is presently comprised of the fms-like tyrosine kinase receptor, Flt or Flt1 (VEGFR-1), the kinase insert domain-containing receptor, KDR (also referred to as Flk-1 or VEGFR-2), and another fms-like tyrosine kinase receptor, Flt4 (VEGFR-3). Two of these related RTKs, Flt and KDR, have been shown to bind vascular endothelial growth factor (VEGF) with high affinity (De Vries et al, 1992, Science 255: 989-991; Terman et al, 1992, Biochem. Biophys. Res. Comm. 1992, 187: 1579-1586). Binding of VEGF to these receptors expressed in heterologous cells had been associated with changes in the tyrosine phosphorylation status of cellular proteins and calcium fluxes. VEGF, along with acidic and basic fibroblast growth factor (aFGF & bFGF) have been identified as having in vitro endothelial cell growth promoting activity. It is noted that aFGF and bFGF bind to and activate the receptor tyrosine kinase termed FGFR-1. By virtue of the restricted expression of its receptors, the growth factor activity of VEGF, in contrast to that of the FGFs, is relatively specific towards endothelial cells. Recent evidence indicates that VEGF is an important stimulator of both normal and pathological angiogenesis (Jakeman et al, 1993, Endocrinology, 133: 848-859; Kolch et al, 1995, Breast Cancer Research and Treatment, 36: 139-155) and vascular permeability (Connolly et al, 1989, J. Biol. Chem. 264: 20017-20024).

In adults, endothelial cells have a low proliferation index except in cases of tissue remodeling, such as wound healing and the female reproductive cycle, and adipogenesis. However in pathological states such as cancer, inherited vascular diseases, endometriosis, psoriasis, arthritis, retinopathies and atherosclerosis, endothelial cells are actively proliferating and organizing into vessels. Upon exposure to angiogenic stimuli with growth factors such as VEGF and bFGF, endothelial cells re-enter the cell cycle, proliferate, migrate and organize into a three-dimensional network. It is now widely accepted that the ability of tumors to expand and metastasize is dependent upon the formation of this vascular network.

Binding of VEGF or bFGF to their corresponding receptor results in dimerization, autophosphorylation on tyrosine residues and enzymatic activation. These phosphotyrosine residues serve as “docking” sites for specific downstream signaling molecules and enzymatic activation results in EC activation. Disruption of

these pathways should inhibit endothelial cell activation. Disruption of the FGFR-1 pathway should also affect tumor cell proliferation since this kinase is activated in many tumor types in addition to proliferating endothelial cells. Finally, recent evidence also suggests that disruption of VEGF signaling inhibits endothelial cell migration, a critical process in vascular network formation.

The over-expression and activation of VEGFR-2 and FGFR-1 in tumor-associated vasculature has suggested a role for these molecules in tumor angiogenesis. Angiogenesis and subsequent tumor growth is inhibited by antibodies directed against VEGF ligand and VEGF receptors, and by truncated (lacking a transmembrane sequence and cytoplasmic kinase domain) soluble VEGFR-2 receptors. Dominant mutations introduced into either VEGFR-2 or FGFR-1 which result in a loss of enzymatic activity inhibits tumor growth *in vivo*. Antisense targeting of these receptors or their cognate ligands also inhibits angiogenesis and tumor growth. Recent evidence has elucidated, in part, the temporal requirements of these receptors in tumor growth. It appears that VEGF signaling is critical in early tumor growth and bFGF is more important at a later time associated with tumor expansion.

### **Use and Utility**

The present invention is based on the discovery that certain pyrrolotriazines are inhibitors of protein kinases. More specifically, they inhibit the effects of VEGF, a property of value in the treatment of disease states associated with angiogenesis  
30 and/or increased vascular permeability such as cancer. The invention relates to a pharmaceutical composition of compound of formula I, or pharmaceutically acceptable salt or hydrate thereof, and a pharmaceutically acceptable carrier in the

treatment of hyperproliferative disorder in mammal. In particular, the said pharmaceutical composition is expected to inhibit the growth of those primary and recurrent solid tumors which are associated with VEGF, especially those tumors which are significantly dependent on VEGF for their growth and spread, including for  
5 example, cancers of the bladder, squamous cell, head, colorectal, oesophageal, gynecological (such as ovarian), pancreas, breast, prostate, lung, vulva, skin, brain, genitourinary tract, lymphatic system (such as thyroid), stomach, larynx and lung. In another embodiment, the compounds of the present invention are also useful in the treatment of noncancerous disorders such as diabetes, diabetic retinopathy, psoriasis,  
10 rheumatoid arthritis, obesity, Kaposi's sarcoma, haemangioma, acute and chronic nephropathies (including proliferative glomerulonephritis and diabetes-induced renal disease), atheroma, arterial restenosis, autoimmune diseases, acute inflammation and ocular diseases with retinal vessel proliferation, diabetic retinopathy, retinopathy of prematurity and macular degeneration. The invention also relates to prevention of  
15 blastocyte implantation in a mammal, treatment of atherosclerosis, excema, sclerodema, hemangioma. Compounds of the present invention posses good activity against VEGF receptor tyrosine kinase while possessing some activity against other tyrosine kinases.

Thus according to a further aspect of the invention, there is provided the use of  
20 a compound of formula I, or a pharmaceutically acceptable salt thereof in the manufacture of a medicament for use in the production of an antiangiogenic and/or vascular permeability reducing effect in a mammalian animal such as a human being.

According to a further feature of the invention there is provided a method for producing an antiangiogenic and/or vascular permeability reducing effect in a  
25 mammalian animal, such as a human being, in need of such treatment which comprises administering to said animal an effective amount of a compound of formula I or a pharmaceutically acceptable salt thereof as defined herein before.

The compounds described herein also inhibit other receptor tyrosine kinases including HER1 and HER2 and are therefore useful in the treatment of proliferative  
30 disorders such as psoriasis and cancer. The HER1 receptor kinase has been shown to be expressed and activated in many solid tumors including non-small cell lung, colorectal, and breast cancer. Similarly, the HER2 receptor kinase has been shown to

be overexpressed in breast, ovarian, lung and gastric cancer. Monoclonal antibodies that downregulate the abundance of the HER2 receptor or inhibit signaling by the HER1 receptor have shown anti-tumor efficacy in preclinical and clinical studies. It is therefore expected that inhibitors of the HER1 and HER2 kinases will have efficacy  
5 in the treatment of tumors that depend on signaling from either of the two receptors. The ability of these compounds to inhibit HER1 further adds to their use as anti-angiogenic agents. See the following documents and references cited therein:

The antiproliferative, antiangiogenic and/or vascular permeability reducing treatment defined herein before may be applied as a sole therapy or may involve, in  
20 addition to a compound of the invention, one or more other substances and/or treatments. Such conjoint treatment may be achieved by way of the simultaneous, sequential or separate administration of the individual components of the treatment. The compounds of this invention may also be useful in combination with known anti-cancer and cytotoxic agents and treatments, including radiation. If formulated as a  
25 fixed dose, such combination products employ the compounds of this invention within the dosage range described below and the other pharmaceutically active agent within its approved dosage range. Compounds of formula I may be used sequentially with known anticancer or cytotoxic agents and treatment, including radiation when a combination formulation is inappropriate.

30 In the field of medical oncology it is normal practice to use a combination of different forms of treatment to treat each patient with cancer. In medical oncology the other component(s) of such conjoint treatment in addition to the antiproliferative,

antiangiogenic and/or vascular permeability reducing treatment defined herein before may be: surgery, radiotherapy or chemotherapy. Such chemotherapy may cover three main categories of therapeutic agent:

- 5 (i) antiangiogenic agents that work by different mechanisms from those defined hereinbefore (for example, linomide, inhibitors of integrin  $\alpha v \beta 3$  function, angiostatin, razoxane);
- 10 (ii) cytostatic agents such as antiestrogens (for example, tamoxifen, toremifene, raloxifene, droloxifene, idoxifene), progestogens (for example, megestrol acetate), aromatase inhibitors (for example, anastrozole, letrozole, bora-zole, exemestane), antihormones, antiprogestogens, antiandrogens (for example, flutamide, nilutamide, bicalutamide, cyproterone acetate), LHRH agonists and antagonists (for example, gosereline acetate, leuprolide), inhibitors of testosterone  $5\alpha$ -dihydroreductase (for example, finasteride), farnesyltransferase inhibitors, anti-invasion agents (for example, metalloproteinase inhibitors like marimastat and inhibitors of urokinase plasminogen activator receptor function) and inhibitors of growth factor function, (such growth factors include for example, EGF, FGF, platelet derived growth factor and hepatocyte growth factor such inhibitors include growth factor antibodies, growth factor receptor antibodies such as Avastin® (bevacizumab) and Erbitux® (cetuximab); tyrosine kinase inhibitors and serine/threonine kinase inhibitors); and
- 20 (iii) antiproliferative/antineoplastic drugs and combinations thereof, as used in medical oncology, such as antimetabolites (for example, antifolates such as methotrexate, fluoropyrimidines like 5-fluorouracil, purine and adenosine analogues, cytosine arabinoside); Intercalating antitumour antibiotics (for example, anthracyclines like doxorubicin, daunomycin, epirubicin and idarubicin, mitomycin-C, dactinomycin, mithramycin); platinum derivatives (for example, cisplatin, carboplatin); alkylating agents (for example, nitrogen mustard, melphalan, chlorambucil, busulphan, cyclophosphamide, ifosfamide, nitrosoureas, thiotepa;

15 vessel proliferation such as diabetic retinopathy.

More specifically, the compounds of formula I are useful in the treatment of a variety of cancers, including (but not limited to) the following:

- 20 -carcinoma, including that of the bladder, breast, colon, kidney, liver, lung, including small cell lung cancer, esophagus, gall bladder, ovary, pancreas, stomach, cervix, thyroid, prostate, and skin, including squamous cell carcinoma;

-other tumors, including melanoma, seminoma, teratocarcinoma, osteosarcoma, xenoderma pigmentosum, keratoanthoma, thyroid follicular cancer and Kaposi's sarcoma.

Due to the key role of kinases in the regulation of cellular proliferation in general, inhibitors can act as reversible cytostatic agents which may be useful in the treatment of any disease process which features abnormal cellular proliferation, e.g., benign prostate hyperplasia, familial adenomatous polyposis, neuro-fibromatosis, atherosclerosis, pulmonary fibrosis, arthritis, psoriasis, glomerulonephritis, restenosis following angioplasty or vascular surgery, hypertrophic scar formation, inflammatory bowel disease, transplantation rejection, endotoxic shock, and fungal infections.

Compounds of formula I may induce or inhibit apoptosis. The apoptotic response is aberrant in a variety of human diseases. Compounds of formula I, as modulators of apoptosis, will be useful in the treatment of cancer (including but not limited to those types mentioned hereinabove), viral infections (including but not limited to herpesvirus, poxvirus, Epstein-Barr virus, Sindbis virus and adenovirus), prevention of AIDS development in HIV-infected individuals, autoimmune diseases (including but not limited to systemic lupus, erythematosus, autoimmune mediated glomerulonephritis, rheumatoid arthritis, psoriasis, inflammatory bowel disease, and autoimmune diabetes mellitus), neurodegenerative disorders (including but not limited to Alzheimer's disease, AIDS-related dementia, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa, spinal muscular atrophy and cerebellar degeneration), myelodysplastic syndromes, aplastic anemia, ischemic injury associated with myocardial infarctions, stroke and reperfusion injury, arrhythmia, atherosclerosis, toxin-induced or alcohol related liver diseases, hematological diseases (including but not limited to chronic anemia and aplastic anemia), degenerative diseases of the musculoskeletal system (including but not limited to osteoporosis and arthritis) aspirin-sensitive rhinosinusitis, cystic fibrosis, multiple sclerosis, kidney diseases and cancer pain.

The compounds of formula I are especially useful in treatment of tumors having a high incidence of tyrosine kinase activity, such as colon, lung, and pancreatic tumors. By the administration of a composition (or a combination) of the compounds of this invention, development of tumors in a mammalian host is reduced.

Compounds of formula I may also be useful in the treatment of diseases other than cancer that may be associated with signal transduction pathways operating through growth factor receptors such as VEGFR-2 and FGFR-1.

5       The compounds of this invention may be formulated with a pharmaceutical vehicle or diluent for oral, intravenous or subcutaneous administration. The pharmaceutical composition can be formulated in a classical manner using solid or liquid vehicles, diluents and additives appropriate to the desired mode of administration. Orally, the compounds can be administered in the form of tablets, capsules, granules, powders and the like. The compounds may also be administered  
10       as suspensions using carriers appropriate to this mode of administration. The compounds may be administered in a dosage range of about 0.05 to 800 mg/kg/day, preferably less than 500 mg/kg/day, in a single dose or in 2 to 4 divided doses.

Activity is determined by quantitating the incorporated radioactivity using a Packard TopCount Microplate Scintillation Counter following

the addition of Microscint-20 cocktail into each dried well of the UniFilter microplates.

The instant compounds inhibit VEGFR-2 and FGFR-1 kinases with IC<sub>50</sub> values between 0.001 to 10  $\mu$ M. Preferred compounds have IC<sub>50</sub> values less than 0.3  $\mu$ M against VEGFR-2.

These compounds are selective against VEGFR-2 and FGFR-1 kinase enzymes. They have minimum activity against HER-2, CDK kinases, LCK and Src kinases.

1-(5-Isopropyl-4-methylsulfanylpyrrolo[2,1-*f*][1,2,4]triazin-6-yloxy)-propan-  
2-ol (262mg, 0.93 mmol, obtained from Example 25 using procedure in Step B of  
10 Example 7) and 1-triisopropylsilanyl-1*H*-pyrrolo[2,3-*b*]pyridin-5-ylamine (290 mg,  
0.93mmol) were dissolved in chloroform and *m*-chloroperbenzoic acid (60%, 535mg,  
1.86 mmol) was added. The mixture was heated at 120°C for 10 min in a Personal

Chemistry Smith Enrys Optimizer™ microwave oven. The solution was evaporated *in vacuo* and the residue was purified by preparative HPLC. The isolated product was dissolved in THF (10 mL) and TBAF (1.0 M, 0.2 mL, 0.2 mmol) was added. The mixture was stirred for 5 min. and the solvent was evaporated *in vacuo*. The residue  
5 was purified by preparative HPLC to afford the title compound (3 mg, 1%).

The intermediate, **1-triisopropylsilanyl-1*H*-pyrrolo[2,3-*b*]pyridin-5-ylamine** was prepared as follows:

10 A. 4-Chloro-1-triisopropylsilanyl-1*H*-pyrrolo[2,3-*b*]pyridine (10 g, 32.5 mmol) was dissolved in THF (250 mL) and cooled to -78°C. *Sec*-Butyllithium ( 54.8 mL, 1.3M/cyclohexane, 71.4 mmol.) was then added dropwise and the solution was stirred for 20 min. A solution of tosylazide (16 g, 81.2 mmol.) in THF (100 mL) was added and the mixture was stirred for 1 h. The reaction mixture was quenched with saturated  
15 ammonium chloride (50 mL) and warmed to RT. This mixture was extracted with hexanes (2 x 200 mL) and the combined organic layers were dried. The organic phase was filtered and concentrated *in vacuo*. The crude product was purified by flash chromatography (silica gel, 100% hexanes) to afford 5-azido-4-chloro-1-triisopropylsilanyl-1*H*-pyrrolo[2,3-*b*]pyridine as a mixture with starting material (10.2

25 solid was removed by filtration over Celite® and the solution was evaporated *in vacuo*. The crude product was purified by flash chromatography (silica gel, 95% hexanes, 5% ethyl acetate) to afford 4-chloro-1-triisopropylsilanyl-1*H*-pyrrolo[2,3-*b*]pyridin-5-ylamine (730 mg, 43.5% , 2 steps).

30 C. 4-Chloro-1-triisopropylsilanyl-1*H*-pyrrolo[2,3-*b*]pyridin-5-ylamine (10.2 g, 31.5 mmol) was diluted in ethyl acetate (200 mL) and acetic acid (100 mL). Zinc dust (50 g, 0.8 mol.) was added in small portions at RT. After stirring the suspension at

RT for 4 h, the mixture was filtered over Celite and the filtrate was slowly neutralized with saturated sodium bicarbonate and extracted with ethyl acetate (2 x 300 mL). The combined organic layers were dried, filtered and evaporated *in vacuo*. The crude product was purified by flash chromatography (silica gel, 5% ethyl acetate in  
 5 hexanes) to afford 1-triisopropylsilanyl-1*H*-pyrrolo[2,3-*b*]pyridin-5-ylamine (6.38 g).
